In this project the candidates were soppused to make a tic tac toe game employin api and service class. This project had somewhat of a medium difficulty and core of it was figuring out the service class. This project has 3 activiteis the first activity is the main one and it has two buttons that give an alert dialog which then lead to another activity called game activity.

project2

Tre På Rad

Create game

Player name

CANCEL   CREATE

START NEW GAME

JOIN AN EXISTING
GAME

In game activity we find the core of the application where we have buttons and state displayed on them using private funcionts. The game id is shown up so anybody can join and play and down we have the name of the players and whether they use x or o.

Another thing is that there is a function that sayes if the player chooses x then I will play with o and vise versa and it's.

When there is a when situation then we jump with context intent to another activity where you can go and play again if needed.

project2

You Are The Winner

PLAY AGAIN
